

A High School in North GA, had an unusually high water usage overnight

Challenge

A High School in a North Georgia school system had recently brought a water monitor online into their Building Management System. Within just three weeks they received an alert that the school **was using 85 gal/hr more than usual**. This high usage continued overnight and into the next day.

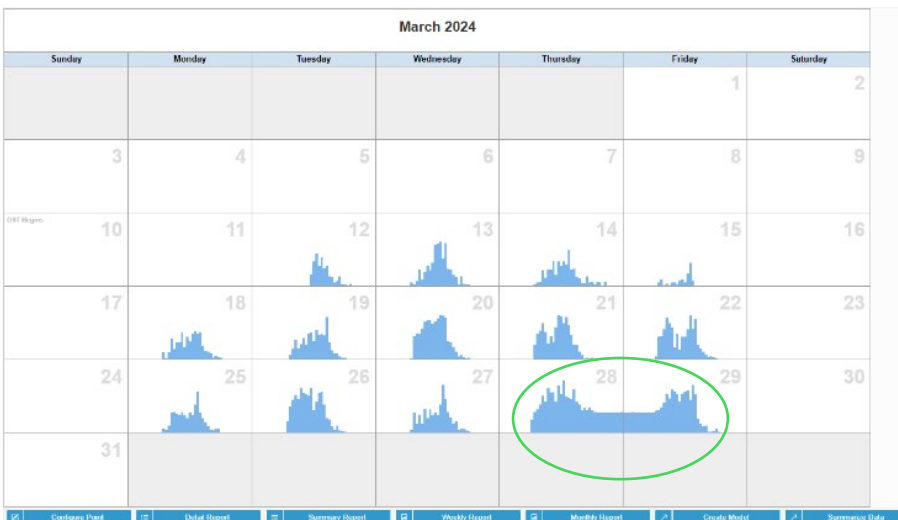

Solution

An automated alert was generated and sent to the facilities department indicating unusually high overnight water consumption. Seeing a significant anomaly on the system report, facility maintenance dispatched a crew to the site and were able to isolate the leak within a few hours.

Savings

With the WattShaver smart water monitoring system and real-time alerts, the issue was resolved immediately. Should this have continued unnoticed for weeks it would have resulted in **several thousand dollars** of excess water use before the issue was noticed on the bill.

Utilizing a low-cost, smart water monitor with the WattShaver System will ensure these and many other water, electrical and HVAC anomalies are recognized before they become costly maintenance issues.
